DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 3/22/04 has been entered.

Election/Restrictions

- 2. Applicant's election without traverse of Figure 2, claims 8-15, 37-44, and 66-73 in Paper No. 8 is acknowledged.
- 3. Claims 1-7, 16-36, 45-65, and 74-87 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected embodiment, there being no allowable generic or linking claim. Election was made **without** traverse in Paper No. 8.

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 8-15, 37-44, and 66-73 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yanagihara (5,374,958) in view of Reininger et al (5,426,463).

.

Application/Control Number: 09/905,039

Art Unit: 2613

Yanagihara, in Figures 1, 11, 13, and 14, discloses substantially the same method for reducing chroma noise as specified in claims 8-15, 37-44, and 66-73 of the present invention, comprising in a YUV video image compression system utilizing a variable quantization step size q and a quantization parameter QP representing the size of the step where an increase in QP corresponds to a larger quantizing step size, selecting one of reducing chroma noise during compression of a color video image (e.g. still block) and achieving higher compression during compression of the color video image (e.g. motion block); in response to selecting reducing chroma noise, utilizing a first QP value for the Y luminance channel of a color video image (e.g. 4*SQ), and utilizing a second QP value for at least one of the U and V color channels of the color video image (e.g. 8*SQ); and in response to selecting achieving higher compression utilizing a first QP value for the Y luminance channel of a color video image (e.g. 4*SQ), and utilizing a second QP value for at least one of the U and V color channels of the color video image (e.g. 8), wherein the second QP value 8 is greater than the first QP value (e.g. 4*SQ), so that at least one of the U and V color channels has coarser quantization resolution than the luminance channel.

With respect to claims 9, 10, 13, 14, 38, 39, 42, 43, 67, 68, 71, and 72, Yanagihara also discloses that the second QP value (e.g. 8*SQ) is determined by applying a bias value 2 to the first QP value (e.g. 4*SQ); and compressing the color video image (Fig. 11), after application of the first and second QP values, to a compressed output image 13.

Application/Control Number: 09/905,039

Page 4

Art Unit: 2613

It is noted Yanagihara differs from the present invention in that it fails to particularly disclose quantizing the color channels with greater resolution than the luminance channel and any decompression details as specified in claims 8-15, 37-44, and 66-73. Reininger et al however, in Figure 2, teaches the concept of such well known variable second QP value 14 is less than the first QP value (i.e. variably controlled), so that at least one of the color channels C has greater quantization resolution than the luminance channel Y; and decompressing the compressed output image (16, 17) using the first and second QP values to obtain an uncompressed video image.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made, having both the references of Yanagihara and Reininger et al before him/her, to exploit the common variable bit rate quantizing method as taught by Reininger et al in the YUV video image compression system of Yanagihara in order to adaptively quantize the luminance and color channels to efficiently achieve bandwidth reduction.

Response to Arguments

6. Applicant's arguments with respect to claims 8-15, 37-44, and 66-73 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Naimpally et al discloses high-definition video encoding system having color-sensitive quantization.
